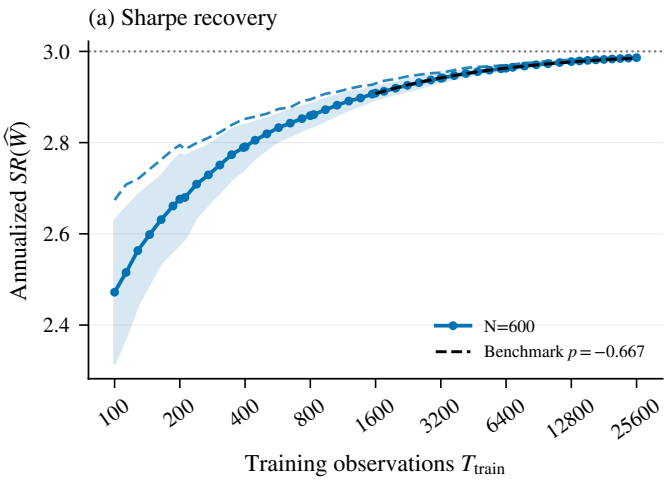
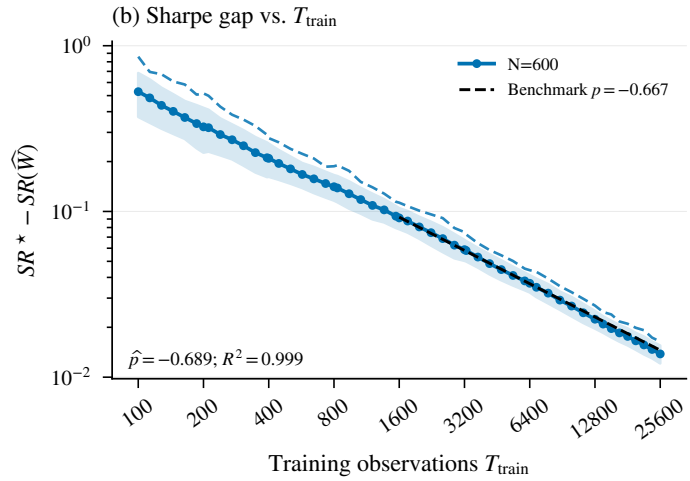
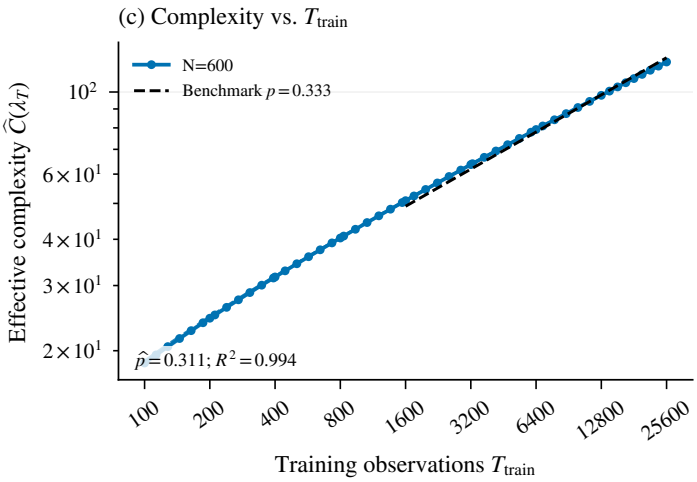
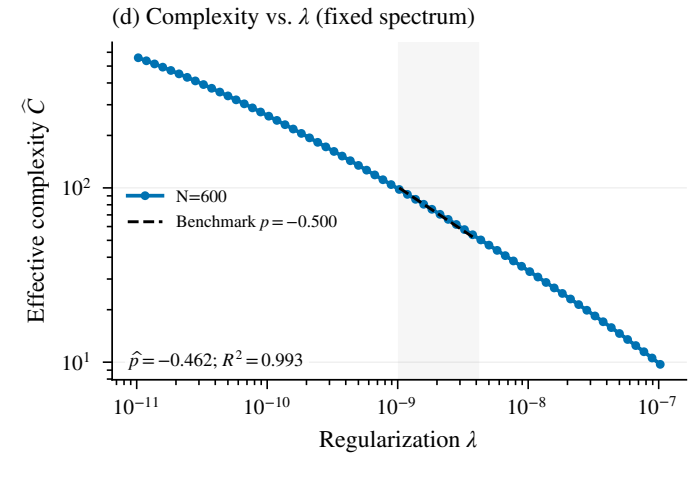
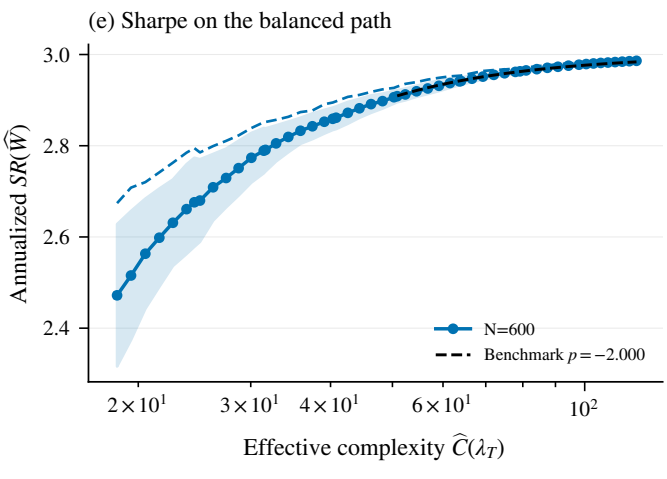
Complete reference cell: N=600, $\rho = 0.5$; Nyström rank 1024

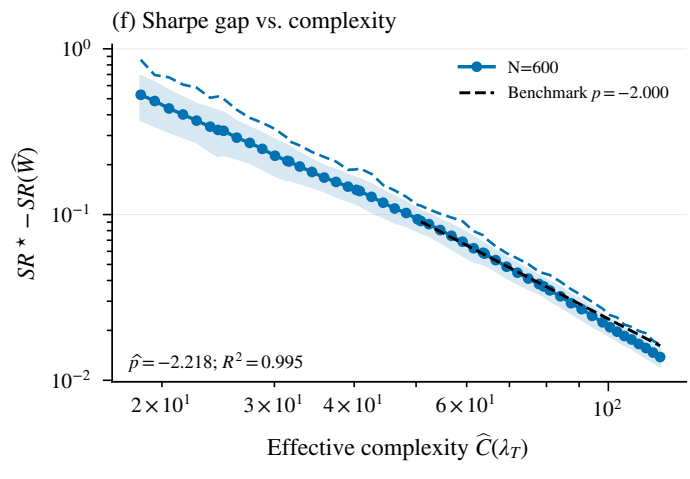




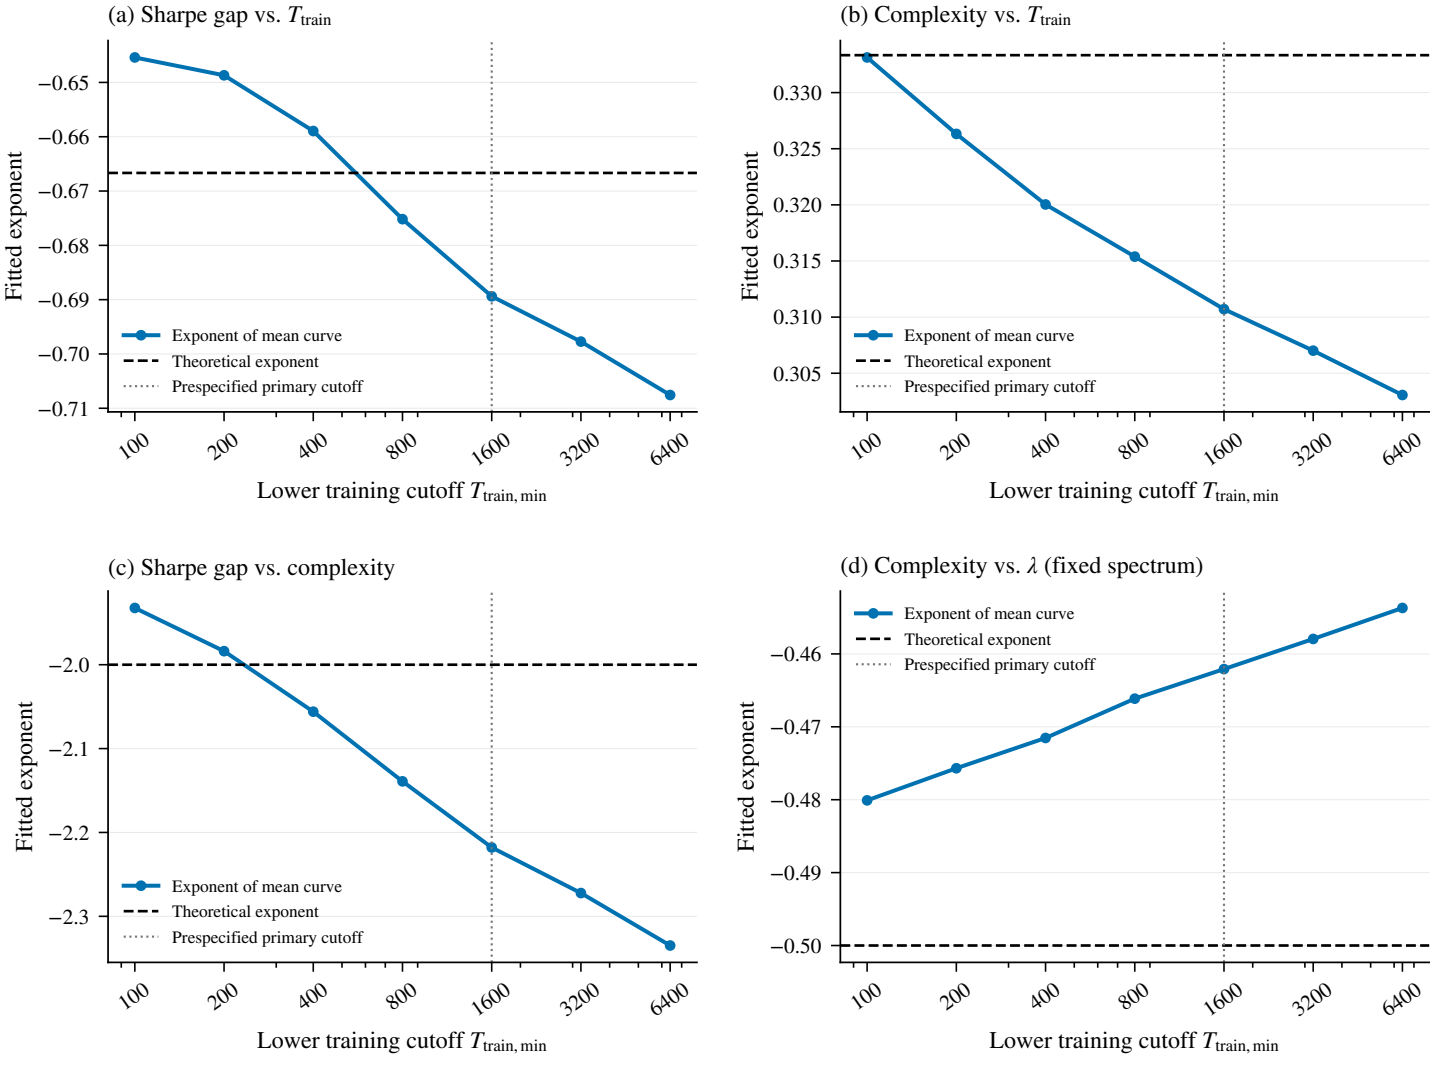








100 independent training replications; all 54 actual training sizes shown. Solid: mean; shading/bars: ±1 sample SD; colored dashes: trial 95th percentile.
Main benchmark fits: T_train >= 1600; fixed spectrum T_train=12800. Reference cell only; comparisons across N and rho are reported separately.
Sharpe percentiles use mean complexity at the same T; horizontal complexity SD bars at original training anchors.



Complete reference cell: 100 replications, N=600, rho=0.5. Every declared cutoff is retained.
The complexity-lambda cutoff defines a penalty interval on the same fixed training spectrum; no fit window is selected by its slope.
